## HEPA Air Diffuser

For Secondary Air Filtration / IAQ  
into Occupied Spaces

## Introducing the Whisper Clean HEPA Air Diffuser

Introducing yet another game changing item we have added to our product line...the Whisper Clean HEPA Air Diffuser!

The USA-Made Whisper Clean HEPA Air Diffuser is a secondary air filtration system easily attached to negative air machines. It can be used in level 3 containment jobs in healthcare facilities where external exhaust is not an option. The Whisper Clean HEPA Air Diffuser makes it safe to exhaust into occupied areas using gentle diffusion – removing the strong blast of air that negative air machines typically exhaust. It can also be used in hazardous material removal jobs in abatement, remediation, or any other contained project with similar challenges. From medical facilities to commercial and residential jobs, this multi-use product can be used in almost any location.

The HEPA diffuser filter is rated at 2,256 CFM 99.99% at 0.30 micron, wow! This secondary HEPA filtration provides an extra layer of protection during dust-rich projects and infection control situations in health care facilities. It helps deliver more ACH and manage the large volume project exhaust when maintaining negative pressure.

Other benefits include

- Reducing energy loss by not exhausting conditioned air outside
- Eliminating having to remove a window for exhaust and breaching the building envelope
- Reducing the decibel level of the negative air machine exhaust by more than 20%
- Attached wheels for easy portability and relocation

Why route yards upon yards of flex ducting through a building just to reach a window or door when you can softly exhaust in the same room where the job is being done?
